• •	Community	Hunstanton		
Community details	Flood Risk	Highest risk flooding mechanism	Surface Water	
uetalis	Summary	Most likely source of flooding	Surface Water	
		<ul> <li>The area benefitting from defences information does not extend into this community</li> <li>Repairs and improvements were made to Hunstanton Sea Front following storm damage in December 2013. This includes:         <ul> <li>Emergency repairs to the promenade</li> <li>New flood gates to the promenade</li> </ul> </li> <li>The Environment Agency report that defences in the south of Hunstanton help to reduce the risk of flooding to 642 residential properties and around 3,500 caravans and holiday homes. During the December 2013 tidal surge, these flood defences helped reduce the impact of flooding.</li> <li>It is recorded by the Environment Agency that: 'the shingle banks south of Hunstanton have to rebuilt every year to repair the erosion that has taken place over autumn and winter. This beach recycling is the most sustainable way to protect the coast at this location'. 75% of the costs of beach recharge works have been committed by the 'East Wash Community Interest Company'.</li> </ul>		
Opportunities for sustainable development	Asset management	Schemes following on from the Wash East Coastal Management Strategy are currently under construction to protect 280 households as part of the Environment Agency pipeline of works. The Strategy confirms that it is sustainable to hold the line for the short and medium term. It has also confirmed that it is preferable to continue with the existing balance of hard and soft defences in this area, including maintaining the existing groynes. In the longer term, continued beach recycling may not be sustainable, for economic, social or environmental reasons. The Strategy has developed an 'adaptable' approach to the future management of this coastline which does not preclude any future opportunities to further improve the standard of protection - dependent on available funding. The Strategy identifies the need for the authorities and the community to work together to fund the on-going maintenance of the defences.

Community details	Flood Risk	Highest risk flooding mechanism Surface Water		Surface Water
uetans	Summary	Most likely source of floodi	ng	Surface Water
Requirements for drainage control and impact mitigation	Broad scale assessment of possible SuDS	Bedrock Geology       Chalk, sandstone and mudstone.         Superficial Geology       No data available         Soil Type       Impeded drainage.         Groundwater Source       No         Protection Zone       No         Historic Landfill Site       No         •       Further investigation of SuDS on a site specific basis due to the variety or levels of risk from groundwater identified for this community in the Areas Susceptible to Groundwater Flooding dataset.         •       Source control techniques are likely to be suitable for this community.         •       Infiltration techniques will be suitable providing there are areas of the site not at high or medium ground water flood risk.         •       Detention features may be feasible providing site slopes are <5% at the location of the detention feature. If the site has groundwater issues, then a liner will be required.         •       Filtration systems are probably suitable providing site slopes are <5% and the depth to the water table is >1m. If the site has groundwater issues, then a liner will be required.         •       All forms of conveyance features are likely to be suitable. Where slopes are >5%, features should follow contours or		
NPPF and planning implications	Existing Local Considerations	<ul> <li>utilise check dams to slow flows.</li> <li>The Wash Shoreline Management Plan 2: Gibraltar Point to Old Hunstanton illustrates the importance of shoreline management in Hunstanton Town. Present management involves the use of hard defences, mainly a sea wall and groynes, to provide protection from vertical erosion.</li> <li>Hunstanton Coastal Management Plan will be completed soon and will be part of a strategy to manage risk to Hunstanton's coastline. This includes finding the best way to maintain protection provided by the promenade and sea defences, and to reduce the rate of erosion of Hunstanton's cliffs.</li> <li>Areas to the south of Hunstanton are located within the DM18 Coastal Flood Risk Hazard Zone, in the Adopted Local Plan and the proposed Coastal Change Management Area. The Hazard Zone stretches from along the coastline to Hunstanton and seeks to prevent any new caravan parks in rapid inundation zones and new ground-floor residential development.</li> <li>There are a number of coastal defences in Hunstanton. Developers should liaise with the Environment Agency and consider whether a financial contribution towards the long-term maintenance and/ or upgrade of the defences would be appropriate to help safeguard against increasing flood risk over the lifetime of the development.</li> </ul>
